

MANAGING SAT WORD LIST DATA

CS-410 Software Engineering – Fall 2026

Quentin Lehman

Find all versions of the project throughout the development in the link below.

Repository: <https://github.com/Xopl2/Managing-SAT-Word-List-Data---CS410>

OVERVIEW:

This project was created as an organization tool for words, it includes features such as checking definitions, creating and deleting entries, and saving changes made. Engineered using React via CDN, it uses the “words.dat” file in the project file as its data source

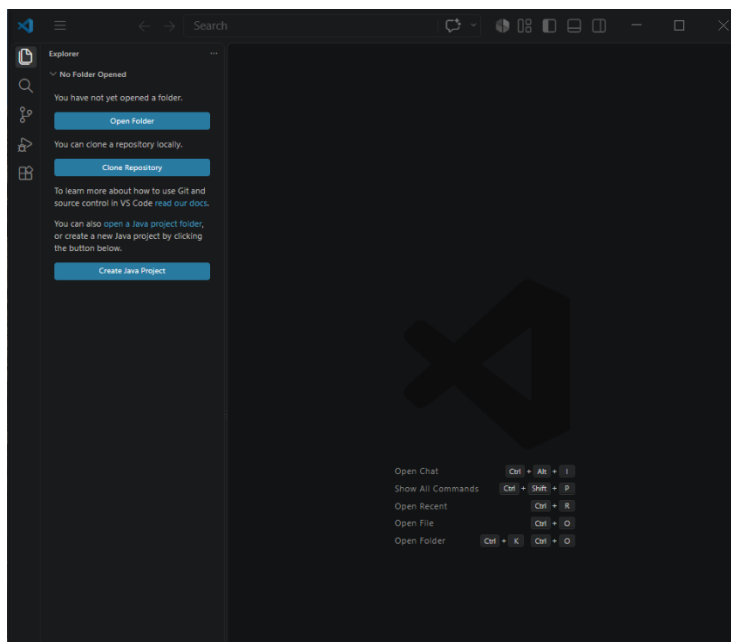

LAUNCHING THE APPLICATION:

Using this app currently requires you to use the Live Server extension via VS Code. It is available at this link:

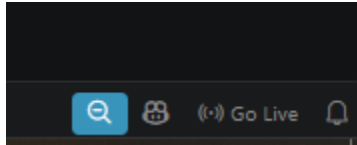

<https://marketplace.visualstudio.com/items?itemName=ritwickdey.LiveServer>

Ensure you have both the newest version of VS Code, and the LiveServer extension installed before proceeding.

To launch the application, open the projects root directory via the “open folder” option in VS Code or via CTRL+O

Once you have the project's root directory open in VS Code, click on the "Go Live" button in the bottom right corner of the VS Code window. This opens the applications window in a new browser window

USING THE APPLICATION

The application window has 5 main buttons for functionality as well as a scrollable list containing all the words in the "words.dat" file

1. "Add New Entry" button
Opens the "Add Entry" window, it allows for a new word, with its type and meaning to be added to the word list. (Doesn't immediately save to the file)
2. "Delete Entry" button
Opens the "Delete Entry" window, which allows you to delete an entry from the list. (Doesn't immediately save to the file)
3. "Check Meaning" button
Opens the "Check Meaning" window, it allows the user to look up information about any word that is in the list.
4. "Save Word List" button
Allows the user to save an updated "words.dat" that contains the current state of the in-memory word list, including any deletions or additions that happened during the session.
5. "Quit Application" button
Closes the application window

SAVING CHANGES

To save your changes please select the "Save Word List" button and navigate to the projects root directory, this will overwrite the "word.dat" file with an updated one containing any new entries added or any deleted words that the user changed during the session

TESTING WITH DIFFERENT DATA

To change the data being used to test simply replace the “words.dat” file with a different “words.dat” file in the project’s root directory

BEYOND THE SPECIFICATION

I’ve included a scrollable bar to see the words in the list and a “Delete Entry” button to the project for ease of use, I know these were not required for the project explicitly. However, I believe that they make the application easier to use and more practical

KNOWN LIMITATIONS

Currently saving requires a chromium-based browser to be used, if you want to save your changes.
